# EECS 442 Discussion 

Arash Ushani

October 14, 2015

## Announcements

- HW2 due 10/15
- Project Proposals due $10 / 22$
- Jon Beaumont from ETC coming in next week for a Midterm Student Feedback session

## HW2 Problem 1a

$$
\begin{aligned}
M & =\left[\begin{array}{ll}
A & b
\end{array}\right] \\
M^{\prime} & =\left[\begin{array}{lll}
A^{\prime} & b^{\prime}
\end{array}\right] \\
\hat{M} & =\left[\begin{array}{ccc}
a_{11} & a_{12} & a_{13} \\
a_{21} & b_{1} \\
0 & a_{22} & a_{23} \\
b_{2} \\
0 & 0 & 1
\end{array}\right]
\end{aligned}
$$

- $a_{i j}$ is not referring to the elements of $A$
- $b_{i}$ is not referring to the elements of $b$

## Stereo Cameras

- Why use more than one camera?

(a) Left

(b) Right

Sample stereo images from OpenCV

## Correspondence Problem

- Point in image (a), where is it in image (b)?

(a) Left

(b) Right

Sample stereo images from OpenCV

## Correspondence Problem

- Can't determine exactly, but can constrain with epipolar geometry

(a) Left

(b) Right

Sample stereo images from OpenCV

## Epipolar geometry

- Epipolar Plane
- Baseline
- Epipolar Lines
- Epipoles $\mathrm{e}_{1}, \mathrm{e}_{2}$
= intersections of baseline with image planes
= projections of the other camera center

## Epipolar Geometry

- "Point transfer via plane $\pi$ " (See HZ Chp 9)

$$
\begin{aligned}
x & =H_{1} x_{\pi} \quad x^{\prime}=H_{2} x_{\pi} \\
x^{\prime} & =H_{2} H_{1}^{-1} x \\
x^{\prime} & =H_{\pi} x
\end{aligned}
$$

## Epipolar Geometry

- What is the epipole?

## Epipolar Geometry

- What is the epipole?

Just where one camera is in the other camera's frame

## Epipolar Geometry

- What is the epipole?

Just where one camera is in the other camera's frame

- Given point $x^{\prime}$, what is the epipolar line passing through $x^{\prime}$ and $e^{\prime}$ ?

## Epipolar Geometry

- What is the epipole?

Just where one camera is in the other camera's frame

- Given point $x^{\prime}$, what is the epipolar line passing through $x^{\prime}$ and $e^{\prime}$ ?

$$
I^{\prime}=e^{\prime} \times x^{\prime}=\left[e^{\prime}\right]_{x} x^{\prime}
$$

## Epipolar Geometry

- What is the epipole?

Just where one camera is in the other camera's frame

- Given point $x^{\prime}$, what is the epipolar line passing through $x^{\prime}$ and $e^{\prime}$ ?

$$
I^{\prime}=e^{\prime} \times x^{\prime}=\left[e^{\prime}\right]_{x} x^{\prime}
$$

- Recall that $x^{\prime}=H_{\pi} x$

$$
\begin{aligned}
& I^{\prime}=\left[e^{\prime}\right]_{x} H_{\pi} x \\
& I^{\prime}=F X
\end{aligned}
$$

where $F=\left[e^{\prime}\right]_{x} H_{\pi}$.

## Fundamental Matrix: Rank

- $F=\left[e^{\prime}\right]_{x} H_{\pi}$
- What is the rank of $H_{\pi}$ ?

## Fundamental Matrix: Rank

- $F=\left[e^{\prime}\right]_{x} H_{\pi}$
- What is the rank of $H_{\pi}$ ? 3
- What is the rank of $\left[e^{\prime}\right]_{x}$ ?

## Fundamental Matrix: Rank

- $F=\left[e^{\prime}\right]_{x} H_{\pi}$
- What is the rank of $H_{\pi}$ ? 3
- What is the rank of $\left[e^{\prime}\right]_{x}$ ? 2
- Rank of a product is in the minimum of the ranks of the terms in the product, so $\operatorname{rank}(F)=\min \left(\operatorname{rank}(H), \operatorname{rank}\left(\left[e^{\prime}\right]_{x}\right)=2\right.$
- Makes sense, because we're mapping points to lines, and multiple points can end up on the same line

## Fundamental Matrix: Degrees of Freedom

- Recall that $F$ is rank 2

$$
\left[\begin{array}{ccc}
a & b & c \\
d & e & f \\
\alpha a+\beta d & \alpha b+\beta e & \alpha c+\beta f
\end{array}\right]
$$

## Fundamental Matrix: Degrees of Freedom

- Recall that $F$ is rank 2

$$
\left[\begin{array}{ccc}
a & b & c \\
d & e & f \\
\alpha a+\beta d & \alpha b+\beta e & \alpha c+\beta f
\end{array}\right]
$$

- So 8 degrees of freedom left

## Fundamental Matrix: Degrees of Freedom

- Recall that $F$ is rank 2

$$
\left[\begin{array}{ccc}
a & b & c \\
d & e & f \\
\alpha a+\beta d & \alpha b+\beta e & \alpha c+\beta f
\end{array}\right]
$$

- So 8 degrees of freedom left
- Recall what we're using $F$ for: $I^{\prime}=F x$
- Everything is in homogeneous coordinates, $F$ only defined up to scale

## Fundamental Matrix: Degrees of Freedom

- Recall that $F$ is rank 2

$$
\left[\begin{array}{ccc}
a & b & c \\
d & e & f \\
\alpha a+\beta d & \alpha b+\beta e & \alpha c+\beta f
\end{array}\right]
$$

- So 8 degrees of freedom left
- Recall what we're using $F$ for: $I^{\prime}=F x$
- Everything is in homogeneous coordinates, $F$ only defined up to scale
- Therefore, $F$ has 7 degrees of freedom

## Fundamental Matrix: Correspondence Condition

- The epipolar line for $x$ is given by $I^{\prime}=F x$
- What do we know about the corresponding point $x^{\prime}$ ?

## Fundamental Matrix: Correspondence Condition

- The epipolar line for $x$ is given by $I^{\prime}=F x$
- What do we know about the corresponding point $x^{\prime}$ ? $x^{\prime}$ lies on $I^{\prime}$

## Fundamental Matrix: Correspondence Condition

- The epipolar line for $x$ is given by $I^{\prime}=F x$
- What do we know about the corresponding point $x^{\prime}$ ? $x^{\prime}$ lies on $I^{\prime}$
- Therefore, $x^{\prime^{\top}} I^{\prime}=x^{\prime \top} F x=0$

## Fundamental Matrix: Correspondence Condition

- The epipolar line for $x$ is given by $I^{\prime}=F x$
- What do we know about the corresponding point $x^{\prime}$ ? $x^{\prime}$ lies on $I^{\prime}$
- Therefore, $x^{\prime^{\top}} I^{\prime}=x^{\prime^{\top}} F x=0$
- What about $F^{\top}$ ?
- $\left(x^{\prime^{\top}} F x\right)^{\top}=x^{\top} F^{\top} x^{\prime}=0$

## Fundamental Matrix: Relationship with Epipoles

- Given any point $x, I^{\prime}=F x$

## Fundamental Matrix: Relationship with Epipoles

- Given any point $x, I^{\prime}=F x$
- Epipolar lines always pass through epipole (no matter what point $x$ we choose)

$$
\begin{array}{r}
e^{\prime \top} l^{\prime}=0 \\
e^{\prime \top} F X=0 \\
e^{\prime \top} F=\left[\begin{array}{l}
0 \\
0 \\
0
\end{array}\right]
\end{array}
$$

## Fundamental Matrix: Relationship with Epipoles

- Given any point $x, I^{\prime}=F x$
- Epipolar lines always pass through epipole (no matter what point $x$ we choose)

$$
\begin{array}{r}
e^{\prime \top} l^{\prime}=0 \\
e^{\prime \top} F X=0 \\
e^{\prime \top} F=\left[\begin{array}{l}
0 \\
0 \\
0
\end{array}\right]
\end{array}
$$

- So, $e^{\prime}$ is the left null-vector of $F$
- Similarly, $e$ is the right null-vector of $F$
